

Senior Software Developer

About Us

We are a group of passionate technology professionals who are committed to delivering best-in-class software solutions for the non-profit space. We care deeply about our clients' needs and understand that the work we do has a direct impact on their ability to continue improving the lives of many different people and groups. We develop in .NET (C#), HTML, CSS, JavaScript, SQL, and anything else we need to in order to get the job done correctly and quickly.

About the Job

The Senior Software Developer is responsible for all aspects of the development and delivery of our applications. You should possess most or all of the following skills:

- Be able to understand the SDLC model and what your specific activities are in designing and then delivering a solid, robust application
- Understand how to develop and enforce coding standards and source code development standards
- Design and develop code that is clean, understandable, maintainable and SOLID
- Design, develop and implement test plans to accurately test the application code, functions, modules and program
- Develop and maintain detailed and accurate documentation per all project standards

About You

We are looking for individuals who love building software. You should have experience, but also be willing to stretch and learn new things.

- You keep your skills up to date. You recognize the importance of spending time with different technologies in order to make the correct decisions on what you will use in your next project.
- You consider yourself above average in your knowledge of .NET and know what has changed and what will be changing next.
- You love to build "vertical slices" of software and don't want to get pigeonholed as the "Front-end" or "Back-end" developer in the shop.
- You are fine with raw CSS, but SASS and/or LESS have made your life better.
- Raw HTML doesn't scare you, but you also know that there are many ways to get it to the browser.
- JavaScript is just fine. You also try to keep up on new tools/frameworks (Node, Angular, React, RxJS, etc.)
- SQL isn't just for DBAs. It is important that Software Developers know how to write and tune their scripts.
- You can communicate clearly both in-person and through written mediums.
- Testing your code has saved the day on many occasions.

Education/Experience

We recognize that not every Senior Developer has a CS degree, and that not every Developer with a CS degree is a Senior Developer. We have noticed, however, that the people who succeed in this role generally have some combination of the following experience/education:

- About 3-8 years of professional Software Development experience
- About 3-5 years of experience using C# professionally
- About 2-5 years using some JavaScript/HTML/CSS
- About 2-5 years of SQL experience
